Success stories:

Customized solutions that have been successfully implemented by Chowgule Mediconsult:

'Real Time Laboratory TB Surveillance' project to track cases of TB (Tuberculosis) being treated by private practitioners (other than DOTS and DOTS Plus sites) on real time basis. This is a customized software for State Tuberculosis Control Society for capturing real-time information of all non-RNTCP (Revised National TB Control Programme) patients in the State being treated by private practitioners. Integration with standard LIMS (Laboratory Information Management System) package is also included in the project so that laboratories do not need to separately enter data into this system – thus avoiding extra manpower deployment as well as data entry errors. The program is aimed at providing information to all DTOs (District TB Officers), CTOs (City TB Officers) and the STO (State TB Officer) including contact details, treating physician details and test results for all private patients in the State. This data when combined with data of RNTCP patients in Nikshay, will give the exact prevalence figures of TB in the state.

Customized software for State Health Society to electronically store health check-up data of school children under the Nayee Pidhi Swasthya Guarantee Karyakram (NPSGK) which is now merged with Rashtriya Bal Swasthya Karyakram (RBSK).

Thus, if you are looking for a customized solution to collect, save and analyze public health data digitally and turn it into actionable information, then Chowgule Mediconsult is your answer.

Customized Software for Public Health Records

■ Ease of managing large amount of data

■ Customized software ensures complete data capture and analytics

■ Helps monitor progress of programs on "Real Time" basis

■ End-to-end solutions with software, hardware integration as well as data entry

Med Docket ™

■ Recording and making sense of huge data with powerful analytics is now smarter than ever before

Introducing

Med Docket™

ELECTRONIC HEALTH RECORD SYSTEMS BY CHOWGULE MEDICONSULT

The Electronic Public Health Record system that revolutionizes huge amount of data storage and its accurate analysis.

Public Health Records

Projects in public health generally involve collating huge amount of data. Such projects could be those undertaken by:

- State/Central government

- NGOs (Non-government organizations)

- Large private organizations

- Group of hospitals

- Group of doctors

The data / registry generated by such projects offer vital insights into various aspects of disease such as prevalence, course, prognosis, outcomes of different interventions, etc. Now in order to put this data into an actionable form, it's vital to analyze different parameters such as:

- Clinical

- Demographic

- Financial

Huge Data Storage and Powerful Analytics

Chowgule Mediconsult can develop customized software, which allows the digital storage of such huge amount of data for immediate access at any time. Furthermore, it uses advanced analytic tools to slice and dice the data into many different actionable areas.

Expertise offered

Our expert medical and IT teams with their in-depth domain knowledge clearly understand and envisage the needs of data flow, data capture, data analysis and apply this while customizing the software for you, using the latest Information and Communication Technology tools.

Prime advantages

- Captures the correct flow of data in a given project

- Renders the data analyzable on different parameters

- Helps draw meaningful conclusions from the available data and plan policies accordingly

- Allows digital storage of huge amount of data

In a nutshell, what you get is an end-to-end integrated solution that includes

- Software development

- Hardware procurement and integration

- Data hosting

- Data backup

- Data entry solutions
